

The Big Picture: How Microsoft Foundry Fits Together

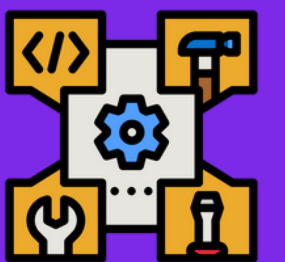

Microsoft Foundry is a unified Azure platform-as-a-service offering for enterprise AI operations, model builders, and application development.

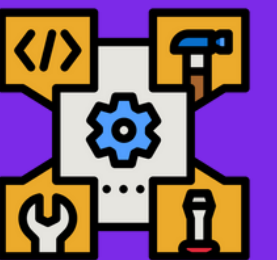

Microsoft Foundry unifies agents, models, and tools under a single management grouping with built-in enterprise-readiness capabilities.

- We design agents in Foundry, and those agents are hosted and managed in Microsoft Azure.
- Agents are called from external business applications.
- Client applications talk to agents, not to models.

- The agent is intelligence with behavior.
- An agent sits on top of one or more deployed models.

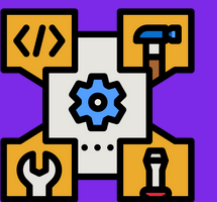

Agents and Workflows in Agentic AI Systems

Agentic AI apps are not just agents.

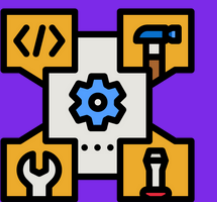

Real-world systems are built from **two complementary components**:

- Agents
- Workflows

Endpoints – How Applications Talk to Foundry

An endpoint is a network address your application uses to communicate with Foundry services.

Agentic AI Systems

**Business Application → Agents → Models +
Workflows → Result**
