

AI Agents vs. AI Workflows in Microsoft Foundry

Workflows vs. Agents

AI workflow – structured, predefined sequence of steps.

AI agent – decision-making system.

Workflows execute processes. Agents make decisions.

Microsoft Foundry is a mature,
enterprise-ready platform for building,
orchestrating, and governing AI
workflows and agentic systems.

Workflows vs. Agents

AI systems **rarely fail** because the model itself is bad. They fail because the **interaction model** is wrong.

- If you need control and predictability, use workflows.
- If you need judgment and flexibility, use agents.
- If you need both, combine them.

**Most production AI systems are not
“one model, one prompt, one
response.”**

Most production AI systems are not
“one model, one prompt, one
response.”

They’re structured, repeatable
workflows where each step has a clear
responsibility.
